Betreff: Journalist's question about Sigg Lining

I'm working on a story about the proliferation of metal drinking bottles in the wake of the BPA scare.

I've read conflicting information about the make-up of the lining in Sigg bottles. I've seen both "water-based resin" and "water-based epoxy resin." Which is it, and does the lining now, or has it ever contained BPA?

Thankyou.

Subject: AW: Journalist's question about Sigg Lining

Dear Curt

Thanks for your Email. One of the reasons SIGG is the world leader in manufacturing of premium water bottles is because of our proprietary bottle liner. This special liner is a water-based, non-toxic polymer which has been perfected over decades of SWISS craftsmanship. We are proud to say that SIGG' has the very best liner in the world. In addition, SIGG's liner protects from any migration or leaching of the liner & container into the liquid. All tests of the liquid reveal no trace (0%) of any of the following chemicals:

Perfluorooctanoic Acid (PFOA), Bisphenol A (BPA) and Bisphenol B (BPB)

SIGG'bottles are safe!

If you have any further questions do not hesitate to contact me

Kind regards

Betreff: Re: AW: Journalist's question about Sigg Lining

I've read the material about the test results on the liner.
But my question is, why test for the presence of BPA if BPA is not present to begin with in the product? So can I conclude that the liner does contain some BPA?
Thanks.
